

ABSTRACT OF THE DISCLOSURE

For each word, a spell check program may determine whether the spelling is correct. If the spelling is correct and an EOF has not been reached, then the next word may be parsed from the current data file. When the spelling is not correct, then it may further be determined whether the word includes a HLD. When it is determined that the word is not a HLD, then a user is prompted to correct the spelling. When it is determined that the word includes a HLD then it may be determined whether the word is to be linked. If the word is to be converted into a link then a hyperlink reference is generated from the word and steps are repeated until an EOF is reached or the next word includes a HLD.
